Hi John
I wanted to share the results of the male squirrel analysis with you. It turns out that has been a consistent calculation error in all of the data that Rachel's lab has analyzed. Luckily the fix is to simply divide all of the results by 10, so I will have to go back over all of the datapoints from 2015 on and do that calculation. Interestingly though this will lower the concentration values of all FGM substantially. Thank you for approving the funds for this. It turned out to be only $720 in addition to the 600 that I had from my T&E grant.

Hi Stuart,
Attached is the male red squirrel data for both White Mtn. and Mt. Graham. When I calculate the data as Rachel did the values seem similar to those previously analyzed. I spoke to Rachel concerning a discrepancy in the dilution calculation. In the tabs at the bottom there is one marked " fecal data" with the results done as per Rachel's calculations and another marked "corrected data". I believe it would only require dividing all data by 10 for correction. Please let me know if you have any questions.

Best Regards,
Niki
