TAHU assessment 5/13/16:

Start time: 0912

Tunnel visits- 1.0 #12653 "Graham" tunnel= 1.
0.1 #12678 "Spruce" tunnel= 0 ,did enter initially. Graham observed flipping in tunnel repeatedly.

Vocalizations- Graham was heard "chattering" at various times during observation, beginning at 0916. By 0918, Spruce had returned "chatter" call. After one such chatter call at about 0922, Graham was heard buzz calling briefly.

Based on the observed calling back and forth, as well as the reproductive vocalization, it was decided to introduce animals to one another.

TAHU introduction 5/13/16:

Start time: 0936

Animal #12653 "Graham" given full access to #12678 "Spruce's" enclosure. After initial chase, "Spruce" retreated to nest box. It was here that she began vocalizing, a lot. First with a peep, which then progressed into a "peep" "buzz" call mix.

At 0937, "Graham" was observed circling nest box that "Spruce" was in. This behavior progressed by "Spruce" coming out of nest box while still "buzz" calling. At that time, "Graham" "buzz" called back, and this communication lead to a chase that resulted in "Graham" chasing "Spruce" into her nest box (about 0949). They interacted in the box briefly, but Graham emerged with an injured right front foot. Graham then retreated to a high perch and began responding to "Spruce's" "buzz" calls with a "chatter".

By 1001, "Spruce" had emerged from her nest box while still calling, however this call was more of a "buzz/bark" mix. She then worked her way high into the enclosure, appearing to purposefully regain the attention of "Graham". She was successful at regaining his attention after his injury and a series of chases began with the animals ranging the entire enclosure, stopping only when Spruce would make her way into a hanging tube. This chase/retreat to hanging tube interaction occurred repeatedly for the next few minutes; with calls from both animals increasing in frequency. At this time, it was my observation that the animals wanted to progress physical interactions but the size and area of hanging tube was not appropriate.

At 1009, "Spruce" emerged from hanging tube with her ventral side facing me. At this time, I observed major swelling of the anogenital region.

At ~1026, "Graham" was observed physically removing "Spruce" from her hanging tube, located on the right side of her enclosure. This move resulted in the animals coming together on the enclosure floor for about ~15seconds, touching genital regions repeatedly. After the animals separated, a small amount of blood was observed on both animals genitals as well as "Graham's" penis observed to be semi-erect.

After this event, "Spruce" retreated to her nest box, Graham to a high perch. Calls from both animals stopped and by 1100 they were safely separated.
